us up and transform us." -
Superman

Noor Hassuneh joined the MJ team as an enterprise data intern and has since stepped into a full-time role as an associate software engineer on the same team. In this role, Noor helps build and maintain the web applications, APIs, and internal automations that power APERTURE and keep MJ's operations running smoothly. Working closely with the lead software architect and senior engineers, he contributes code, tests, and documentation while learning MJ's engineering practices from the ground up. His work supports the integrations and automations that cut down on manual work across the company, giving his teammates more time to focus on higher-value projects.

Prior to his internship at MJ, Noor built full-stack features for a technology startup, working across authentication systems, profile management, and backend scalability while contributing to AI chatbot and calendar functionality within a mobile app. He also spent time in media production, supporting content creation and market research for client campaigns, and served as a teaching assistant at Indiana University Indianapolis, mentoring students through core object-oriented programming concepts. That mix of building, creating, and teaching gives Noor a practical, detail-oriented approach that he brings to every feature and integration he ships for MJ.

Outside of MJ, Noor can be found watching soccer, catching up on his favorite shows, and spending time with family—preferably with something sweet close by. Japan tops his travel bucket list, and he's looking forward to checking it off one day.
